# CS454 Project 1: « Lexer Analysis »

M. Barney, J. Conrad, and S. Patel

March 13, 2013

#### 1 Introduction

This is the final report for project 1, CS454, on lexical analysis.

Our first design decision was to use Haskell's literate mode to prepare all of our code. Secondly, we decided to use the distributed revision control software git for collaborative coding.

We decided to write each algorithm in the assignment as its own module, in addition to modules describing finite state automata (FSA) and regular expressions.

#### 2 Finite State Automaton

In this module we give our data structure for modelling a finite state automaton. The formal definition of an FSA is a 5-tuple, where:

- 1. a finite set of states (Q)
- 2. a finite set of input symbols called the alphabet  $(\Sigma)$
- 3. a transition function  $(\delta : Q \times \Sigma \to Q)$
- 4. a start state  $(q0 \in Q)$
- 5. a set of accept states (F  $\subset$  Q)

We tried to have our data structure mirror the mathematical definition of an FSA as closely as possible.

```
{-# LANGUAGE TypeFamilies, FlexibleContexts,FlexibleInstances #-}
module FiniteStateAutomata (
                               FSA(..),
                               NFA'(..),
                               NFAMap,
                               DFA'(..),
                               DFAMap,
                               epsilon, ppfsa) where
import qualified Data. Map as M
import qualified Data.Set as S

((5, "b"), 2),

((6, "a"), 5),

((7, "b"), 5)]
```

### 3 Regular Expressions

In this module we give the haskell data type for a regular expression; the encoding almost exactly mirrors the definition given in the assignment.

```
module Regex (Regex (..)) where
data Regex a = Alt (Regex a) (Regex a)
| Concat (Regex a) (Regex a)
| Repeat (Regex a)
| Term a
| Empty deriving Show
```

# 4 Algorithms

Our solutions to the "in-memory" algorithms given in §1.2 have been modularized in the following way.

```
module Algorithms (module Thompson,
module Recognize,
module SubsetConstruction) where
import Thompson
import Recognize
import SubsetConstruction
```

In this way we encapsulated (and named) the solutions individually, as the assignment requested.

#### 4.1 Thompson's Algorithm

In this module we provide our solution for converting a regular expression to an NFA.

```
module Thompson (thompson) where
import Prelude hiding (concat)
import qualified Data. Set as S
import qualified Data. Map as M
import FiniteStateAutomata (FSA (trans), NFA' (..), epsilon)
import Regex
thompson :: (Ord\ a, Show\ a) \Rightarrow Regex\ a \rightarrow NFA'\ a
thompson = fst \circ thompson' 0
thompson' :: (Ord \ a, Show \ a) \Rightarrow Int \rightarrow Regex \ a \rightarrow (NFA' \ a, Int)
thompson' lab (Alt r1 r2) = union lab" fsa fsa' where
  (fsa, lab') = thompson' lab r1
  (fsa', lab'') = thompson' lab' r2
thompson' lab (Concat r1 r2) = concat lab" fsa fsa' where
  (fsa, lab') = thompson' lab r1
  (fsa', lab'') = thompson' lab' r2
thompson' lab (Repeat r1) = mrKleene lab' fsa where
  (fsa, lab') = thompson' lab r1
thompson' \ lab \ (Term \ x) = symbol \ lab \ x
thompson' lab Empty = expression lab
expression :: (Ord a, Show a) \Rightarrow Int \rightarrow (NFA' a, Int)
expression label = (fsa, label + 2) where
  fsa = NFA' S.empty (M.fromList [n1]) (S.singleton (label + 1)) label
  n1 = (label, S. singleton (epsilon, (label + 1)))
symbol :: (Ord \ a, Show \ a) \Rightarrow Int \rightarrow a \rightarrow (NFA' \ a, Int)
symbol label sym = (fsa, label + 2) where
  fsa = NFA' (S.singleton sym) (uncurry M.singleton n1) (S.singleton (label + 1)) label
  n1 = (label, S. singleton (fust sym, label + 1))
union :: (Ord\ a, Show\ a) \Rightarrow Int \rightarrow NFA'\ a \rightarrow NFA'\ a \rightarrow (NFA'\ a, Int)
union label nfa0 nfa1 = (fsa, label + 2) where
  (NFA' \ a0 \ m0 \ as0 \ st0) = updateAccepting [(label + 1)] \ nfa0
  (NFA' \ a1 \ m1 \ as1 \ st1) = updateAccepting [(label + 1)] \ nfa1
  fsa = NFA' alpha newMap (S. singleton (label + 1)) label
  alpha = S.union \ a0 \ a1
  newMap = M.unions [m0, m1, epsilonEdges]
  epsilonEdges = M.singleton\ label\ (S.fromList\ [(epsilon, st0), (epsilon, st1)])
concat :: (Ord \ a, Show \ a) \Rightarrow Int \rightarrow NFA' \ a \rightarrow NFA' \ a \rightarrow (NFA' \ a, Int)
```

```
concat label fsa0@(NFA' s0 m0 as0 st0) (NFA' s1 m1 as1 st1) = (fsa, label) where
  fsa = NFA' (S.union s0 s1) (M.union updated m1) as1 st0
  updated = trans $ updateAccepting [st1] fsa0
mrKleene :: (Ord \ a, Show \ a) \Rightarrow Int \rightarrow NFA' \ a \rightarrow (NFA' \ a, Int)
mrKleene\ label\ nfa@(NFA'\ a\ \_\ as\ st)=(fsa,label+2)\ where
  (NFA' - m - ) = updateAccepting [st, (label + 1)] nfa

# 5 Alphabet

This module provides functions for lexing and parsing alphabets found in input files, in addition to an alphabet token data structure.

module Alphabet where

```
import Data.List
data Alphabet =
  Symbol Char
  AlphabetToken |
  EndToken deriving (Show, Eq)
gotoAlphabet[] = []
gotoAlphabet cs | isPrefixOf "alphabet" cs = cs
gotoAlphabet(c:cs) = gotoAlphabetcs
scanAlphabet[] = []
scanAlphabet('a':'l':'p':'h':'a':'b':'e':'t':cs) =
  AlphabetToken: scanAlphabet\ cs
scanAlphabet('\':c:cs) =
  Symbol c: scanAlphabet cs
scanAlphabet('e':'n':'d':cs) =
  [EndToken]
scanAlphabet(\_:cs) =
  scanAlphabet cs
parseAlphabet[] = []
parseAlphabet (AlphabetToken: ts) =
  parseAlphabet ts
parseAlphabet (Symbol c: ts) =
  c: parseAlphabet ts
parseAlphabet (EndToken: ts) =
getAlphabet = parseAlphabet \circ scanAlphabet \circ gotoAlphabet
```

# 6 Input

```
module Input (
    module ParseDFA,
    module ParseNFA,
    module ParseReg,
    module ParseLang) where
import ParseDFA
import ParseNFA
```

```
import ParseReg
import ParseLang
```

#### 6.1 Parse a Regular Expression

This module inputs, lexes, and parses a regular expression from a text file.

```
module ParseReg where
  -- alphabet not being used, need to check for membership
  -- i suppose
import Alphabet
import Regex
import Data.List
import Data.Char (isSpace)
data Tokens =
         AltToken |
         ConcatToken |
         KleeneToken |
          TermToken Char
         EmptyToken deriving (Show, Eq)

tokenize ('+':cs) = ConcatToken:tokenize cs
tokenize\ ('*':cs) = KleeneToken:tokenize\ cs
tokenize ('\':':cs) = EmptyToken:tokenize cs
tokenize ('\': c: cs) = TermToken c: tokenize cs
tokenize (cs) | isPrefixOf "alphabet" cs = []
tokenize\ (c:cs)\ |\ isSpace\ c=tokenize\ cs
tokenize (c:cs) = error ("unknown character"
   # show c ++ " in regular expression")
  -- yea, I know, leave me alone
parse :: [Tokens] \rightarrow Maybe (Regex Char, [Tokens])
parse (AltToken: tokens) =
  case parse tokens of
    fust (regex, tokens') \rightarrow
       case parse tokens' of
          fust (regex', tokens'') \rightarrow
```

```
Just ((Alt regex regex'), tokens")
           \_ 	o \mathit{error} "alternation missing 2nd operand"
     \_ 
ightarrow \mathit{error} "alternation missing 1st operand"
parse (ConcatToken : tokens) =
  case parse tokens of
     fust (regex, tokens') \rightarrow
        case parse tokens' of
           fust (regex', tokens'') \rightarrow
             Just ((Concat regex regex'), tokens")
           \_ 	o \mathit{error} \texttt{"concat missing 2nd operand"}
     _- 
ightarrow \mathit{error} "concat missing 1st operand"
parse (KleeneToken : tokens) =
  case parse tokens of
     Just (regex, tokens') \rightarrow
        Just ((Repeat regex), tokens')
     \_ 
ightarrow \mathit{error} "Kleene star missing operand"
parse (TermToken c: tokens) = Just (Term c, tokens)
parse (EmptyToken: tokens) = Just (Empty, tokens)
getRegex file =
  case (parse ∘ tokenize) file of
     \exists ust (regex, []) \rightarrow
        regex
     \_ 
ightarrow \mathit{error} "regex contains trailing characters"
  -- example
readRegex = do
  source ← readFile "regexp1.txt"
  let regex = getRegex source
  putStrLn $ show regex
```

#### 7 Module: Main.lhs

```
module Main where
import FiniteStateAutomata
import Regex
import Algorithms
import Input
```

```
main =
  putStrLn "(( .x x) helloworld)"
```
